Slides — http://joind.in/14232
Me, Myself and I

PHP Core Developer

Author of
Guide to PHP Security

CIO at Centah Inc.
Why Browser Performance Matters?

phpconference.nl - Total Page Load - 3.73s

- Browser rendering 3.499s
- Back-end Processing 0.232s

PHP.net - Total Page Load - 1.45s

- Browser rendering 1.347s
- Back-end Processing 0.103s

Github - Total Page Load - 1.43s

- Browser rendering 1.43s
- Back-end Processing 0.058.6
What Takes All This Time?

1. DNS
2. HTTP + SSL Negotiation
3. JavaScript Processing
4. CSS Rendering
5. Image Rendering
6. DOM Rendering

by James Balderson
DNS

DNS may take up-to 20% of 1st page load!
DNS Prefetching

Instruct the browser to pre-resolve (sub)domain from which you intend to retrieve resources.

\(<\text{link rel="dns-prefetch" href="/mydomain.tld" />}\)

Supported By:

- Firefox 3.5+
- Chrome
- Safari 5+
- IE 9+
DNS Based Optimizations

1. Use Embedded images via data:image
2. Defer loading of external resources
3. Avoid multi-domain CDNs (7 for DPC)
4. Sub-domains still need to be resolved
Use Sprites & Compress

http://www.spritebox.net/
http://spritepad.wearekiss.com/

phpconference.nl

40 images = 1 Request

64% compression savings (205kb reduction)

12.5% sprite savings (14kb reduction)
Profile Page Loading

• Use Your Browser
  ✴ Developer Tools or Equivalent

• Do Remote Tests
  ✴ http://www.webpagetest.org/
  ✴ https://developers.google.com/speed/pagespeed/
  ✴ https://www.modern.ie/en-us

• Actual User Profiling
  ✴ http://www.lognormal.com/boomerang/doc/
  ✴ Use Web-Timing API directly
Compression For The Win!

Use gzip compression
965.8 KB total in compressible text, savings = 695.2 KB

Compress Images
171.6 KB total in images, savings = 51.8 KB

Compression Reduces data-size by >50% and makes page load in 2.1 seconds!
<table>
<thead>
<tr>
<th></th>
<th>Load Time</th>
<th>First Byte</th>
<th>DOM Elements</th>
<th>Document Complete</th>
<th>Fully Loaded</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Time</td>
<td>Requests</td>
</tr>
<tr>
<td>First</td>
<td>3.731s</td>
<td>0.232s</td>
<td>347</td>
<td>3.731s</td>
<td>63</td>
</tr>
<tr>
<td>Repeat</td>
<td>3.480s</td>
<td>1.865s</td>
<td>347</td>
<td>3.480s</td>
<td>13</td>
</tr>
</tbody>
</table>

WTF?
Cache, Cache, Cache

Set **max-age** or **expires** headers

Value should be at least **30 days**

To prevent stale content, **use unique file names** on new deployments for changed files.

Your goal is that 2nd page load only queries the server for the dynamic content!
JavaScript is loaded synchronously, so compact your files into a single compressed file!
JavaScript

Combination & minifying of JS files is best achieved with:

✦ Closure Compiler
  ✦ http://goo.gl/8MVOIJ

✦ YUI Compressor
  ✦ http://refresh-sf.com/yui/
  ✦ http://yui.github.io/yuicompressor/

✦ PHP Based
  ✦ https://github.com/tedious/JShrink
JavaScript

Don’t over-do combining of JS Files!

- Unnecessary data loading
- Decompression Overhead
- Extra JS Compilation
Micro-Case Study: SlashDot.org

One “BIG” JavaScript file

71kb compressed, 251kb actual size

199ms to receive

37ms to process

21.3% of total page load, 16% of total page size

< 10% of loaded JS code is executed
JavaScript

Only load up-front what you absolutely need

Defer loading of everything else via RequireJS

```html
<head>
  <script src="scripts/require.js"></script>
</head>

require.config({
  baseUrl: 'js/lib',
  paths: { 'jquery': 'jquery-1.11.1' }
});

define(['lib/jquery'], function ($) {...});
```

http://requirejs.org/
If you can’t win, cheat!

$(document).ready(function() {
    setTimeout(function() {
        $.get("your-file.js");
    }, 2000);
});
General JS Tips

1. Avoid Xpath, reference/search by ID

2. Setup events pre-load as opposed to post-load

   onkeyup="js_function()" vs $("input").each(function() {});

3. For Grids only load the data to be displayed

4. `innerHTML` is not always faster than DOM

   http://jsperf.com/dom-vs-innerhtml/37
General JS Tips

- Most browsers leak memory with JS, avoid the common culprits:
  - Use closures
  - Avoid passing objects (can result in circular references)
  - Avoid global variables
General JS Tips

- Help browser to make use of multiple CPUs by using iframes to embed complex components such as grids.
CSS

* Minimize

* Combine

* Compress

* Don’t fear inlined (<style>) CSS
Avoid Repaints & Reflows

• Changes to DOM nodes
• Hiding DOM nodes
• Actions that extend the page (causes scroll)
• Changes to colour, background and outline properties
Merge Style Changes

// slowest
el.style.left = "10px";
el.style.top = "10px";

// getting better
el.className += " top-left-class";

// best
el.style.cssText += "; left: 10px; top: 10px;";
Peekaboo Trick

```javascript
var me = $('#el');
me.hide();

// make various changes to DOM/Content
me.show();
```
Dolly Trick

```javascript
var $dolly = el.clone();

// make changes to the copy
el.replaceWith($dolly);
```
Don’t Abuse Computed Styles

// nein, nein, nein!!!!
for (var i = 0; i < 100; i++) {
    el[i].style.left = el.offsetLeft + "10px";
    el[i].style.top = el.offsetTop + "10px";
}

// Wunderbar
for (var left = el.offsetLeft, top = el.offsetTop, i = 0; i < 100; i++, top+=10, left+=10) {
    el[i].style.cssText += "; left: " + left + "px; top: " + top + "px;";
}
Good Reference Points

http://www.phpied.com/rendering-repaint-reflowrelayout-restyle/

https://developers.google.com/speed/articles/reflow
More CSSery

- Reference by element ID
- Be specific, but avoid child selectors
- Avoid @import()
- Avoid multi-class css rule (.foo.bar.baz)
More CSSery

• Pseudo selectors are slow

• Name space attribute selectors (type="…" vs input[type="…"])

• Eliminate un-used rules

• Avoid browser specific extensions (-webkit, -opera, -moz, etc…)}
